WRITTEN HISTORICAL AND DESCRIPTIVE DATA

FIELD RECORDS

HISTORIC AMERICAN ENGINEERING RECORD
STATE HIGHWAY 79 AT RED RIVER BRIDGE

Location: Carries State Highway (SH) 79 over the Red River, approximately 6 miles southwest of Waurika, Oklahoma, in Jefferson County, Oklahoma, and Clay County, Texas. UTM: 14/583488E/3777185N.

Present Owner: Oklahoma Department of Transportation (ODOT) and Texas Department of Transportation (TxDOT).

ODOT Structure Number: 3416 0050 X
TxDOT Structure Number: 030390028201005

Present Use: Vehicular traffic.

Significance: The bridge carries SH 79 over the Red River between Jefferson County, Oklahoma, and Clay County, Texas. Constructed in 1939, it has 21 identical Camelback pony truss main spans, each with a length of 100 feet, and an overall structure length of 2,255 feet. The structure length and overall magnitude of the SH 79 at Red River Bridge represent a large project completed under the auspices of the Oklahoma Highway Commission (OHC), indicating a significant commitment of funding and comparatively great technical achievement compared to other bridges of its type and period of construction in Oklahoma.[1] While the Camelback pony truss was a relatively common bridge type in Oklahoma during the 1920s and 1930s, it is considered a rare bridge type in Texas. The SH 79 at Red River Bridge is one of only four remaining examples of a bridge with Camelback pony truss main spans in Texas.[2]

The bridge is also significant for facilitating major regional economic development in southwest and south-central Oklahoma and in northwest Texas, as it provided a free, all-weather connection between major oil-producing and agricultural areas in central Oklahoma and the Wichita Falls area in Texas.[3]

The SH 79 at Red River Bridge was determined eligible for the National Register of Historic Places (NRHP) in 1993 by ODOT. TxDOT nominated the bridge for listing in the NRHP under *Criterion A* for significance in the area of Transportation (specifically relating to its ties to regional economic

development) and under *Criterion C* for significance in the area of Engineering. The bridge was listed in the NRHP on December 20, 1996.

Project Information: Historic American Engineering Record (HAER) Level II-equivalent documentation was performed in June 2015. Timothy Smith and Lydia Woods, Cultural Resources Specialists, conducted the on-site recordation and compiled the historical information. During the on-site recordation, Smith and Woods photographed the structure and noted observations on existing conditions. This documentation was prepared as mitigation for demolition and removal of the current bridge.

List of Preparers:

Historians:	Richard E. Mitchell and Lydia Woods Mead & Hunt, Inc. Austin, Texas

Part I. Historical Information

A. Physical History:

1. Date of Construction: 1939.

2. Bridge Designer: Oklahoma Highway Commission.

3. Builder/Contractor/Supplier: The bridge was fabricated by the Virginia Bridge & Iron Company of Roanoke, Virginia. Brooks and Dahlgren, Inc. of Oklahoma City served as the construction contractors.

4. Original Plans: TxDOT maintains a digital version of the original construction plan set on its internal *Crossroads* website. The TxDOT plan set is revised to October 31, 1938, just after the project's Plans, Specifications, and Estimates (PS&E) set had been approved by the U.S. Bureau of Public Roads (BPR). The TxDOT plan set does not incorporate changes made during project construction.

ODOT's Planning and Research Division in Oklahoma City retains a copy of the original construction plan set, revised to May 13, 1939, near the midpoint of project construction. This version likely incorporates as-built modifications to the original design.

5. Alterations and Additions: There have been several erosion control projects to stabilize the meandering river banks through installation of timber pilings, steel and timber jetties, and stone riprap under and adjacent to the bridge.[4] These projects took place between 1956 and 1986. The bridge's steel members have been periodically cleaned and repainted.[5] Otherwise, the bridge has received no appreciable alterations since its original 1939 construction.

B. Historical Context: The SH 79 at Red River Bridge spans the Red River between Jefferson County, Oklahoma, and Clay County, Texas. The nearest communities to the bridge are Waurika, Oklahoma, located approximately 6 miles northeast, and Byers, Texas, located approximately 7 miles southwest. The bridge is located in the Central Great Plains ecological region, also known as the Rolling Plains in Texas or the Redbed Plains in Oklahoma. The region was once characterized by native tallgrass prairie and scattered trees along streams, but has been largely replaced by cropland or mesquite-shortgrass prairie. Silty alluvial sands and gravel, underlain by red shale and sandstone, are in the immediate vicinity of the Red River's wide and meandering channel.[6]

The region surrounding the present SH 79 at Red River Bridge was sparsely settled until the late 1800s and early 1900s. The bridge is located very close to the 98th Meridian. On the north side of the Red River, the 98th Meridian formed the post-Civil War boundary between the Chickasaw Nation to the east and the federally administered Kiowa-Comanche-Apache Indian Reservation to the west. South of the Red River in Texas, Clay County was established in 1857 as the line of settlement moved steadily westward across Texas. The county had 109 residents in 1860, but was depopulated during the Civil War and reorganized in 1873.[7]

Crossing the Red River was often challenging, with floods frequently swelling the channel and silty mud forming quicksands. Native Americans and early European explorers and traders crossed using natural fords along the rivercourse. A ford located about 25 miles downstream from the present SH 79 bridge developed into the crossing for the Chisholm Trail from the late 1860s through the 1880s. The Chisholm Trail served as the most well-known cattle trail of the period, with South Texas cattle herds driven northward on the open range to transcontinental railheads in Kansas. While it was well downstream of present-day SH 79, the Chisholm Trail helped to open up trade and commerce across the Red River in the region.

Permanent settlement in the area blossomed between 1880 and 1910 with the construction of major rail lines. The Fort Worth and Denver City Railway laid track southeast-to-northwest through Clay County in 1882, providing a long-haul railroad line linking area farmers and ranchers to national markets.[8] In 1892 the Chicago, Rock Island and Pacific Railway constructed its north-south line roughly following the old Chisholm Trail from Montague County, Texas, into present-day Jefferson County, Oklahoma, with construction of a bridge over the Red River near present-day US 81.[9] Closer to today's SH 79, the Wichita Falls and Oklahoma Railway constructed a short line from Wichita Falls northeast to Byers in northern Clay County in 1904, presaging the eventual alignment of SH 79.[10] Clay County's population jumped to 5,045 in 1880 and further increased to 9,231 residents in 1900 and 17,043 in 1910.[11] The county's economy was focused on corn and cotton cultivation as well as cattle ranching.[12]

North of the Red River, agricultural development jumpstarted soon after the turn of the century, with growing pressure by non-Native American farmers, ranchers, and speculators to open remaining Indian Territory land for settlement. In 1901 the Kiowa-Comanche-Apache Reservation was opened for non-

Native American settlement through a lottery system. Under the Dawes Commission, communal Chickasaw Nation lands were converted to private ownership through allotment to individual tribal members in the early 1900s, with many allotments sold or lost to non-Native Americans in succeeding years.[13] Soon after the opening of reservation lands, town lots were sold for Waurika, a flag station on the Chicago, Rock Island and Pacific Railway located about 20 miles north of the railroad's Red River crossing. By 1902 the Enid and Anadarko Railway built a branch line connecting the new town with Lawton and Fort Sill, southwest Oklahoma's trade and commercial center. The town had 2,928 residents in 1910, serving a growing agricultural region.[14] Jefferson County was established in 1907 with Oklahoma's statehood. At that time nearly half of the county's land was already under cultivation. Like nearby Clay County in Texas, Jefferson County's economy was based on cotton and corn production, as well as cattle ranching. Jefferson County had 13,439 residents in 1907, quickly rising to 17,430 in 1910.[15]

The discovery of oil and gas at Petrolia in northern Clay County in 1906 further increased development in the area. The relatively small Petrolia Field was the first of many oil fields discovered in northwest Texas. In Oklahoma the Healdton Field was discovered in 1913 in far northeast Jefferson County and neighboring Carter County, becoming the state's most productive oil field a year later. The opening of the massive Electra and Burkburnett oil fields in neighboring Wichita County in the 1910s triggered an economic boom in the region that lasted for two decades. Wichita County's population jumped nearly fivefold between 1910 and 1930 and Wichita Falls became northwest Texas's hub for petroleum-related manufacturing and service industries.[16] Additional oil and gas fields were also discovered in areas north and east of Jefferson County through the 1920s and 1930s, with a corresponding increase in refineries and other related facilities.[17]

In spite of overall regional growth, Clay County's population trended slightly downward in the 1910s, 1920s, and 1930s, as the local Petrolia Field slowly declined in production. The local economies of both Clay County, Texas, and Jefferson County, Oklahoma, were instead increasingly dominated by cotton production and processing.[18] Nonetheless, the petroleum industry continued to drive regional development in northwest Texas and southwest and central Oklahoma.

Sustained expansion of petroleum and agricultural activities led to a need for improved transportation facilities to handle increased commercial and industrial traffic. In 1922 the Wichita Falls and Oklahoma Railway was extended from its original Byers terminus northeastward, crossing the Red River and

terminating at Waurika, where it connected with the main-line Chicago, Rock Island and Pacific Railroad.[19] While additional railroad connections were important freight transportation links, automobile and truck traffic greatly expanded in the early 1900s and brought the need for improved roads and bridges. Spanning the wide Red River channel was an expensive proposition, beyond the financial means of local governments. At the same time, federal and state governments were not involved in roadway bridge construction until the late 1910s and their road-aid programs did not initially focus on large interstate bridges. Instead, early vehicular bridges across the Red River were privately owned and tolled.[20] The Byers Bridge, also known as the 98th Meridian Bridge, connected Byers, Texas, with Hastings, Oklahoma. The privately owned suspension bridge, built in 1914 and reconstructed in 1923 after tornado damage, was located about 6 miles northwest of the present SH 79 at Red River Bridge. A few miles farther west was the Charlie Bridge, a timber structure also built in 1916. A third toll bridge, known as the Ryan Bridge, was located several miles southeast of the SH 79 at Red River Bridge. The Ryan Bridge was a 3,000-foot-long timber trestle bridge constructed in 1927. These three bridges were constructed for local traffic, connecting towns and trade centers on either side of the Red River. Longer-haul traffic across the Red River in the region relied on the Burkburnett-Randlett Bridge about 25 miles west of present-day SH 79, and the Terral-Ringgold Suspension Toll Bridge constructed in 1917 on the Meridian Highway (later US 81) about 20 miles southeast of present-day SH 79.[21] The design of the Red River toll bridges, with their light suspension or wooden trestle spans, reflected the desire to cut costs to a minimum. The bridges were not well-suited for heavier traffic and were subject to damage during Red River flood events.[22]

By the late 1920s public pressure was building in both Oklahoma and Texas to have free interstate bridges, through the purchase of older toll bridges or construction of new structures. As the Red River between Oklahoma and Texas was not considered a navigable waterway by law, the toll bridge operators were not subject to oversight by the federal government. At this time a two-axle automobile was typically charged 75 cents or one dollar to cross the Red River, with higher rates for trucks.[23] As temporary relief against the high toll rates, in 1927 the United States Congress approved a bill to place toll rates on the Red River bridges under the jurisdiction of the War Department. Within a few years Red River toll rates had dropped by 50 percent.[24]

In 1927 the Texas Legislature passed a bill authorizing the Texas Highway Department (THD) to work with adjoining states in obtaining free interstate bridge crossings. The 1927 bill stipulated that Texas would pay up to "one-half of the amount necessary to acquire, construct and maintain any such bridge" in order to obtain the owner rights and that "any bridge now spanning any boundary between States and connecting designated highways of such States may be condemned for public use, and maintained for public use without charge."[25] In 1929 the Oklahoma Legislature passed similar free bridge legislation providing authorization to the OHC to work with the THD on Red River bridges. New free bridges were soon constructed between Randlett, Oklahoma, and Burkburnett, Texas, and between Terral, Oklahoma, and Ringgold, Texas.[26] The old Charlie Toll Bridge was purchased by the two states in 1933.

Even with the construction of new free bridges in the late 1920s and early 1930s, no crossing capable of handling ever-increasing traffic loads and volumes was present between the US 277 bridge near Randlett and the US 81 bridge near Terral, creating a gap of almost 50 miles. In response, the OHC and THD began planning for a new Red River bridge near the Wichita Falls and Oklahoma Railway bridge. The new crossing, oriented on a northwest-southeast alignment, was meant to provide a more direct connection between Waurika and Wichita Falls and the major highways that passed through both cities. In response to public requests for a new free bridge between Waurika and Byers, OHC engineers began preliminary investigations of two possible bridge sites in 1932, both north of the railroad bridge. By early 1934 OHC and THD engineers were in consultation regarding the bridge's eventual location. OHC staff completed preliminary engineering studies in coordination with the THD; however, the OHC lacked sufficient state-match funding to immediately construct the bridge and the project was shelved for over three years.[27]

Preliminary engineering and planning resumed in early 1938, with the OHC, THD, and BPR engineers jointly selecting a bridge location about one mile north of the railroad bridge. This location was determined to be more stable than the alternate site farther north, which was located near a bend in the river and therefore subject to potential scouring. The OHC was responsible for preparation of bridge plans, specifications, and estimates, with the THD providing review and approval. Each state was responsible for half the cost of construction. In May 1938 the OHC placed the SH 79 at Red River Bridge project on its regular Fiscal Year (FY) 1939 Federal Aid Program, with the project designated as Federal Aid Project (FAP) No. 1015-A(1).[28]

OHC engineers began drafting plans by June 1938 and submitted an initial draft to the THD for review on August 1, 1938. The plans called for a 23-span bridge, with 21 Camelback pony truss main spans following the OHC's 1.5E-100 pony truss standard plan and two steel beam approach spans using the OHC's IB-6 steel beam standard plan. The plans also provided for a 26-span steel beam relief bridge, to be located just southwest of the main bridge on the Texas side of the river.[29] During plan review, THD State Highway Engineer Julian Montgomery expressed a desire for aesthetic changes to the bridge's pier design and concrete railings. OHC Bridge Engineer Homer White agreed to the railing changes, which lowered the railing height similar to contemporary THD standards, in an effort to improve visibility. However, White declined to change the design or appearance of the piers. Revised project plans were completed by OHC draftsmen on September 27, 1938, and the OHC submitted the project for BPR approval, which was received in late October 1938. The BPR provided federal funding for about half of the project cost, with each state responsible for half of the matching funds.[30]

Construction bids for the bridge were simultaneously opened in both Oklahoma City and Austin on November 22, 1938. The construction contract was awarded to Brooks and Dahlgren, Inc. of Oklahoma City, which had submitted the low bid of $345,188.50. The bridge's truss spans were fabricated by Virginia Bridge & Iron Company of Roanoke, Virginia. The OHC authorized the project on December 2, 1938, and construction began on January 2, 1939. The 1996 NRHP Nomination notes that "a special provision required the contractor to hire an equal number of laborers from each state."[31]

While bridge construction got underway, both states' highway departments completed roadways leading to the new bridge location. Soon after the initial 1932 planning meetings for the new bridge, the THD extended SH 79 from its terminus at Byers northeastward to the Red River. However, the highway was labeled as a "conditional designation" on the 1933 State Highway map and noted as an unimproved earthen road.[32] In mid-1937 the THD applied for National Recovery Work Relief (NRWR) and Works Progress Administration (WPA) funding to improve the SH 79 roadbed. The roadway was graded and graveled, along with the drainage structures being constructed.[33] The Oklahoma portion of SH 79 was constructed concurrently with the Red River bridge. The July 1938 Oklahoma State Highway map depicts

[29] State of Oklahoma Department of Highways, "Plan and Profile of Proposed State Highway, Federal Aid Project No. 1015-A(1)(1939)," revised 1939, available at Oklahoma Department of Transportation and Texas Department of Transportation.

SH 79 as an earthen road, perhaps still in the planning stages.[34] In July 1939 the OHC authorized work on SH 79 from U.S. Highway (US) 70 southwest to the Red River for grading, graveling, and drainage structures. Oklahoma's SH 79 work was financed as a regular federal-aid project, separate from the bridge project.[35] Both states also undertook small projects on their respective bridge approaches, stabilizing shoulders through the application of oiled asphalt, sodding the sloped approach embankments, and installing guard rail.

Work on the SH 79 at Red River Bridge and its nearby relief bridge was completed ahead of schedule on September 11, 1939, and the project was formally completed in January 1940. The bridge was dedicated and brought into service in February 1940.[36] The project's cost, including both bridges, was $356,029.75. The smaller approach improvement projects, both accomplished as sub-units of the larger federal-aid project, totaled $5,273 for Texas and $2,700 for Oklahoma.[37]

Since its completion in 1939 few alterations have been made to the bridge. Erosion control and bank protection projects were undertaken in the 1950s and again in the early 1980s to prevent the Red River from washing out the banks and compromising the structural integrity of the bridge. General cleaning and repainting of the bridge took place in 1962-1964 and the early 1990s.[38]

Part II. Structural/Design Information

A. General Statement:

1. Character: The SH 79 at Red River Bridge is a 23-span bridge, with 21 Camelback pony truss main spans and a steel I-beam approach span on each end of the bridge. The bridge is noted as a robust example of the Camelback pony truss, a design frequently employed by the OHC during the 1920s and 1930s but rarely constructed in Texas. The bridge was designed using OHC standard designs, slightly modified to accommodate slight changes to the bridge railings as suggested by THD engineers.

2. Condition of fabric: The condition of the bridge is very good. The bridge remains in its original location and has undergone no notable alterations since its original construction in 1939.

B. Description: The SH 79 at Red River Bridge carries SH 79 on an approximate northeast-southwest alignment over the Red River between Jefferson County, Oklahoma, and Clay County, Texas. SH 79 originates in Throckmorton County, Texas, extends northeast through Young and Archer Counties, and continues to Wichita Falls, Texas.[39] The route continues through Petrolia and Byers in Clay County, crosses the Red River into Oklahoma, and ends in Waurika 6 miles inside the state line. When the bridge was constructed in 1939 the main river channel flowed under the first and second truss spans on the west end.

The bridge is comprised of 21 identical riveted, camelback pony-truss spans with a single steel I-beam approach span at each end.[40] The bridge is 3,296'-3" in overall length. Each individual truss span is 100'-0" long, the west approach span is 61'-3" long, and the east approach span is 52'-3" long. Each span has an out-to-out width of 28'-10". The camelback pony truss spans were designed using the OHC's 1.5E-100 pony truss standard plan. The steel beam approach spans were designed using the OHC IB-6 steel beam standard plan.[41]

Each individual truss is comprised of a polygonal top chord of five equal slopes, built up with back-to-back channels riveted with a cover plate on the top and V-bracing on the bottom. The lower chord is built up with back-to-back channels riveted with batten plates on the top and bottom. The vertical and diagonal members are rolled I-section beams, connected to the upper and lower chords with riveted gusset plates. According to the 1938 as-built plans, the trusses were painted with a primer of red lead and two finish coats of aluminum.[42]

---

[39] National Register of Historic Places, *State Highway 79 Bridge at the Red River, Byers, Clay County, Texas*, 7–1.

[40] National Register of Historic Places, *State Highway 79 Bridge at the Red River, Byers, Clay County, Texas*, 7–2.

[41] State of Oklahoma Department of Highways, "Plan and Profile of Proposed State Highway, Federal Aid Project No. 1015-A(1)(1939)."

[42] State of Oklahoma Department of Highways, "Plan and Profile of Proposed State Highway, Federal Aid Project No. 1015-A(1)(1939)."

The floor beams are rolled I-beams with riveted gusset-plate connections at panel points above the lower chord. Extending between the floor beams are six lines of rolled I-section stringers with riveted angle connections to the floor beams. There is diagonal lateral bracing comprised on angle members below the floor beams. A concrete deck was poured directly on top of the stringers.

Each approach span is constructed of seven I-beam stringers. A series of riveted steel diaphragms extends between stringers.

The substructure is comprised of identical reinforced-concrete abutments and 25 identical concrete piers or bents. The abutments are built on pilings and have flat headwalls with sloped and angled wingwalls on either side. Each pier is built on pilings and consists of two outside round columns, each with a pier cap. A flat concrete web-wall extends between the columns to 1'-0" short of grade at the bottom and 1'-0" short of the pier cap at the top. The truss spans are carried by fixed and moveable bearings seated on the pier caps.

The truss-span bearings, termed "shoes" on the plans, are either single or continuous. Single shoes have flat steel plates bolted to the pier caps. They can function as fixed or expansion bearings, depending on whether the anchor bolts allow longitudinal movement of the plate by elongated bolt holes. The continuous shoes function as fixed bearings only. They have long steel plates that connect together the ends of two trusses meeting on the same pier cap. In this way, a continuous fixed bearing anchors each truss end point to the pier cap and also to the adjacent truss.[43]

As indicated on the plans, the approach spans employ a "special cast iron shoe" on the pier cap that is shared with a truss span. Because the approach spans have shallower floor systems than the truss spans, the special cast iron shoe acts as a tall pedestal to raise the approach-span deck. This allows the decks and roadways of the two spans to meet at the same elevation.[44]

The roadway is 24'-0" wide with 1'-6" sidewalks on both sides and a bituminous driving surface. Railings located along both sides of the truss spans consist of a pair of horizontal I-section members mounted on I-section vertical posts. The railings are described in plans as "hand rails" but function as rub rails to protect the truss from vehicular impact.[45] Railings over the approach spans are comprised of a single rectangular concrete rail carried on rectangular concrete posts. Each end post has three ornamental scribed vertical lines on the interior and exterior sides and each interior post has a single ornamental scribed vertical line on either side as well. Modern metal guard rails extend beyond the approach spans. A cast-metal plaque is located in Texas on the north face of the southwest end post and is partially covered by modern guard rail. The plaque has the following inscription:

---

[43] State of Oklahoma Department of Highways, "Plan and Profile of Proposed State Highway, Federal Aid Project No. 1015-A(1)(1939)."

[44] State of Oklahoma Department of Highways, "Plan and Profile of Proposed State Highway, Federal Aid Project No. 1015-A(1)(1939)."

[45] State of Oklahoma Department of Highways, "Plan and Profile of Proposed State Highway, Federal Aid Project No. 1015-A(1)(1939)."

> Red River Bridge | built in 1939 | by the Texas Highway Department | and the Oklahoma Highway Commission | United States Bureau of Public Roads | Texas Highway Commission | Brady Centry Chairman | Harry Hines Member | Robert Lee Bobbitt Member | Julian Montgomery | Highway Engineer | Brooks and Dahlgren | Contractors

C. Site Information: State Highway 79 spans the Red River between Jefferson County, Oklahoma and Clay County, Texas. The bridge is located approximately 6 miles southwest of Waurika, Oklahoma, and approximately 7 miles northeast of Byers, Texas. At this location the Red River flows in a general north-to-south direction, with the bridge crossing the channel and floodplain in a northeast-southwest alignment. The surrounding area is rural, with relatively flat topography that gradually slopes downward to the wide and meandering Red River channel. Near the bridge's location, scrub vegetation and grasses with scattered trees are on the Oklahoma side of the river. Hardwoods with scattered grassy areas are present on the Texas side of the river, within the river's larger floodplain. The general vicinity is typified by agricultural land uses, with cropland and brushy range pasture.

GENERAL NOTES

This construction shall be in accordance with the Oklahoma Standard Specifications of 1937.

All exposed concrete surfaces to have a carborundum finish.

Bearing areas of concrete under all shoes shall be ground with a carborundum brick before placing shoes to secure full bearing of shoes on concrete.

A 40' I.C. Test Pile shall be driven at Abut. #2 at location shown on piling diagram. All I.C. piles shall be driven with a Vulcan No. 1 or equivalent steam hammer. High Early Strength Cement may be used for I.C. Piling, see Sec. 510 Okla. Std. Spec. of 1937.

For details of Abut. #1 see Sh. No. 10

For details of Abut. #2 see Sh. No. 11

For details of Piers see Sh. No. 12

For details of 100' Trusses see Stds. 15E-1004 & 15E-1005, Sh. Nos. 13 & 14.

For details of Roadway for I Bm. spans see Sh. No. 11 and Std. IB-6, Sh. No. 15.

For details of I.C. Piling see Std. CT-6, Sh. No. 18.

Approximately 1900 Cu. Yds. of Cl. A Excav. required to make fill around abuts. to be obtained as directed by Res. Engr.

The fill around abuts. shall be placed and compacted in accordance with Sec. 202.04c.

The structural steel shall be painted in accordance with Sec. 506.04 and Sec. 730 except that (a) three field coats of paint shall be applied, one of red lead (first field spec.) and two of aluminum (second field spec.) (b) Contact surfaces shall be clean and free of paint when assembled.

QUANTITIES — ABUT. NO. 1

Class A Conc.	49.2 Cu. Yds.
Class A Conc. Abut. Base	48.3 Cu. Yds.
Reinf. Steel	10,270 Lbs.
Substr. Excav. Common.	315 Cu. Yds. 18.2
*Substr. Excav. Rock	88.8 Cu. Yds. 100.4

* Rock Excavation computed for average depth of 8.0 ft.

ABUT. NOTES.

All concrete shall be poured in the dry.
Concrete in the footings of Abut. shall be poured against the rock foundation. The quantity of Class A Concrete in Abut. Bases and Substructure Excavation, Rock paid for under those items shall be the amount within the neat lines of the concrete as shown on these plans. Any variation in the elevation of Abut. Bases shall be taken care of in the shafts of the Abuts, any additional concrete shall be paid for as Class A Conc. in Abut. Bases. All cost of such variation shall be included in the unit price bid per Cu Yd. for Class A Concrete in Abut. Base and Substructure Excavation. Rock.

Note: All concrete shall be poured in the dry.

Concrete in the footings of Piers shall be poured against the rock foundation. The quantity of Class "A" Conc. in Pier Bases and Substructure Excavation Rock paid for under those items shall be the amount within the neat lines of the concrete as shown on these plans. Any variation in the elevation of Pier Bases shall be taken care of in the shafts, and any additional concrete shall be paid for as Class A Conc. in Pier Bases. All cost of such variation shall be included in the unit price bid per Cu. Yd. for Cl. A Conc. Pier Bases and Substruct. Excav. Rock.

Round Pier Bases of equivalent area and volume may be substituted for the square bases shown. Plans for the round bases shall be submitted to and approved by the State Highway Commission before construction is started.

GENERAL NOTES

This construction shall be in accordance with Okla. Std. Specifications of 1937.
All exposed concrete surfaces to have a carborundum finish.
Bearing areas of concrete under all shoes shall be ground with a carborundum brick before placing shoes to secure full bearing of shoes on concrete.
Anchor all I Bms at ends marked "Fixed" on General Elevation with 2-1¼"×1'-6" anchor bolts.
For details of 1" Rubber Expansion Joint Filler see Std. CT-6 and Sec. 722.02 Okla. Std. Specifications of 1937.

Note: Approx. 750 Cu. Yds. of Class 'A' Excavation regd. to make fill around Abutments is to be obtained as directed by the Resident Engineer. The fill around Abuts. shall be placed and compacted in accordance with Sec. 202.04c.

Note: A 40' R.C. Test Pile shall be driven as shown in Abut. & Cap details at the following locations:- Abuts. No. 1 & 2, and Bents No. 3-6-9-12-15-18 21, & 24. All R.C. Piles shall be driven with a Vulcan No. 1 or equivalent steam hammer. High early strength cement may be used for R.C. Piling, see Sec. 510 of Okla. Std. Spec. of 1937.

Note: For details of Superstructure see sheet no. 17 and Std. CT-6, sheet no. 18
For details of Abutments see sheet no. 17

Note: The structural steel shall be painted in accordance with Sec. 506.04 and Sec. 730 except that three field coats of paint shall be applied, one of red lead (first field spec.) and two of aluminum (second field spec.).

TYPE "B" CONTRACTION JOINT "CROSSLODE"

CONSTRUCTION NOTES

The Contractor may select the type and combination of expansion and contraction joints he elects to use. After selection is made, the same type of joint shall be used throughout the project.

In addition to chairs indicated, the Contractor shall provide suitable installing devices and such additional stakes as may be required to hold the joint vertical and securely in line and position. The Contractor will also be required to satisfactorily form the upper portion of the joint for receiving the poured Seal.

If type "C" expansion joint is used, the fillers in the top portion of the joint may be omitted during placing of the joint, but shall be inserted immediately upon removal of installing devices. To facilitate such installation, this portion of the filler may be reduced to ⅜" in thickness.

If type "B" contraction joint is used, the lower dividing plate shall be cut to fit subgrade, the upper dividing plate shall be cut to a true crown of the pavement and when the joint is installed, the top shall be parallel to and one-fourth (¼) inch below the finished surface of the pavement. The removable form and stakes shall be removed before the final passage of the finishing machine. Final finishing operations shall close this joint and edging will not be required.

When type "A" contraction joint is used, other dowel holding and spacing devices may be used when approved in writing by the Engineer. To obtain such approval, the Contractor shall submit a detailed drawing of the device he proposes to use. All dowel holding and spacing devices shall be left in place.

Expansion joint fillers of a length less than one half the width of pavement shall not be used except in the case of multiple traffic lane pavement in which event the filler shall be of a length not less than the distance between longitudinal joints.

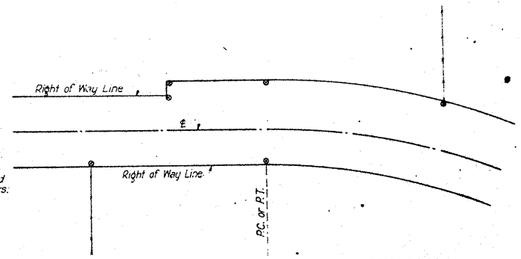
SECTION



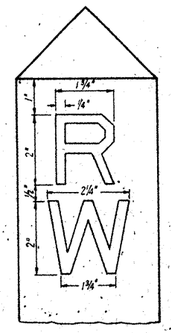
SKETCH SHOWING LOCATION OF RIGHT-OF-WAY MARKERS

Right of Way Markers to be placed at property line intersections, at the P.C. and P.T. of all curves, at all Right of Way corners, and at intervals, on tangent, convenient for sight alignment of fences and not to exceed 660'.

Markers to be set within the Right-of-Way, with back side of the top of Monument on the Right-of-Way line.

Markers to be of Class "A" Concrete and reinforced as shown.

Letters to be placed on one side only and set to face roadway.

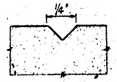


DETAIL OF LETTERS

Letters to be of type shown, ¼" wide at face of Post.

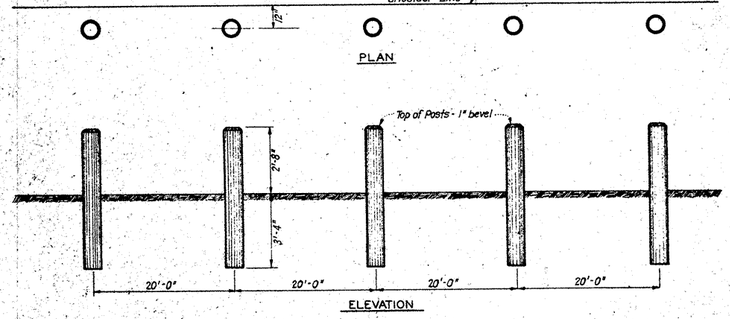
Post to have a carborundum finish. Letters to be painted black.

Letters to be formed by triangular strips.



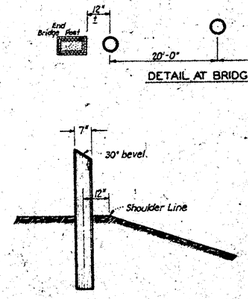
SECTION OF LETTER

RIGHT-OF-WAY MARKERS



PLAN

ELEVATION



SECTION

All round posts shall have a nominal diameter of 7" measured at the top.

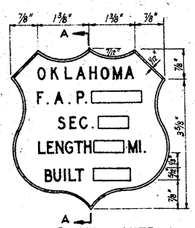
All posts to be creosoted with 16 Lbs. initial treatment and 8 Lbs. final retention.

DETAIL AT BRIDGE END

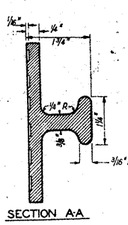
GUIDE POSTS

Markers shall be bronze castings, 65% Copper, 5% Lead, 5% Tin and 5% Zinc. Raised edge, letters and stencil blocks to be polished.

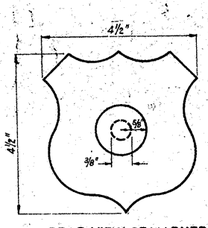
Marker to be placed at beginning and end of Section, paralleling center line.



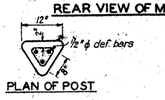
FACE OF MARKER



SECTION A-A

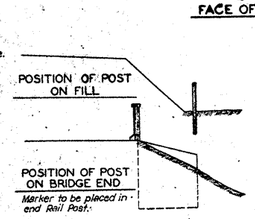


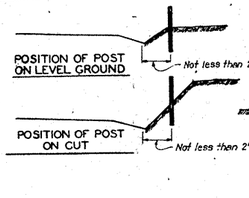
REAR VIEW OF MARKER

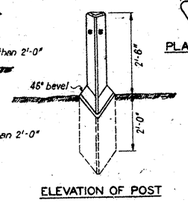


PLAN OF POST

On fill sections place Marker at toe of slope. If fill exceeds 4'-0" place Marker at Right-of-Way line or build foundation.





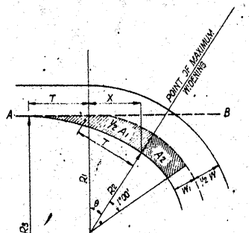


ELEVATION OF POST

Posts to be Class "A" Concrete. Bronze Marker to be placed in 2 sides flush with face. Posts to be chamfered ½" on all square corners. All bars ½" ϕ.

Marker furnished by State. Post furnished by Contractor.

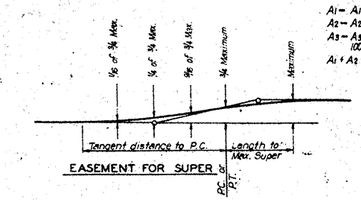
MONUMENTS FOR FEDERAL AID PROJECTS



Note: Where "T" is too long for existing conditions, formulas do not apply. Use "X" as distance from beginning of widening to P.C. or P.T. then:-

$T' = \frac{1}{2} + \frac{50}{R}(R_1 + R_2)$

W = Width of Pavement
W1 = Width of Maximum Widening in Feet
R = ℄ Radius of Curve
R1 = R - ½ W
R2 = R1 - W1
R3 = R1 + R2
θ = Con° ℄
T = R1 Sin. θ
X = T Cos. θ
A1 = $(R_3 + R_1)(\frac{\theta}{3} - .000032321\ \theta^3\ R_2)$ Sq. Yds.
A2 = .00193925 W1 (R1 - ½ W1) Sq. Yds.
S = Super Elevation - Variable - ¾ Maximum at P.C. or P.T.
S = $\frac{.0667}{R}$ per foot of paving - V = Velocity 40 Miles per Hour R = Radius



EASEMENT FOR SUPER

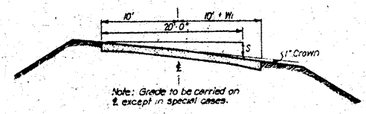
METHOD OF CALCULATING WIDENING AREAS

A1 = A1

A2 = At x (Δ - 2θ)

A3 = As x Length of Curve in 100' Stations

At + A2 + As = Total Additional Area.



Note: Grade to be carried on ℄ except in special cases.

WIDENING AREAS ~ 20' PAVEMENT								SUPER ELEVATION 20' PAVEMENT

GENERAL NOTES

This construction shall be in accordance with the Oklahoma Standard Specifications of 1927.

All exposed concrete surfaces to have a carborundum finish.

Bearing areas of concrete under all shoes shall be ground with a carborundum brick before placing shoes to secure full bearing of shoes on concrete.

A 40' R.C. Test Pile shall be driven at Abut. #2 at location shown on piling diagram. All R.C. piles shall be driven with a Vulcan No. 1 or equivalent steam hammer. High Early Strength Cement may be used for R.C. Piling, see Sec. 510 Okla. Std. Spec. of 1927.

For details of Abut. #1 see Sh. No. 10
For details of Abut. #2 see Sh. No. 11
For details of Piers see Sh. No. 12
For details of 100' Trusses see Stds. 15E-1004 & 15E-1005, Sh. Nos. 13 & 14.
For details of Roadway for 1-Bm. spans see Sh. No. 11 and Std. 1-B-6, Sh. No. 15.
For details of R.C. Piling see Std. CT-6, Sh. No. 18.

Approximately 1900 Cu. Yds. of Cl. A Excav. required to make fill around abuts. to be obtained as directed by Res. Engr.

The fill around abuts. shall be placed and compacted in accordance with Sec. 202.04c.

The structural steel shall be painted in accordance with Sec. 504.04 and Sec. 730 except that (a) three field coats of paint shall be applied, one of "red lead" first field spec.) and "two of aluminum (second field spec.) (b) Contact surfaces shall be clean and "free of paint" when assembled.

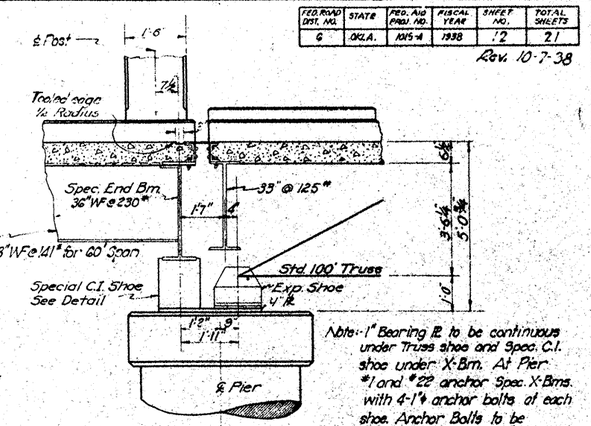
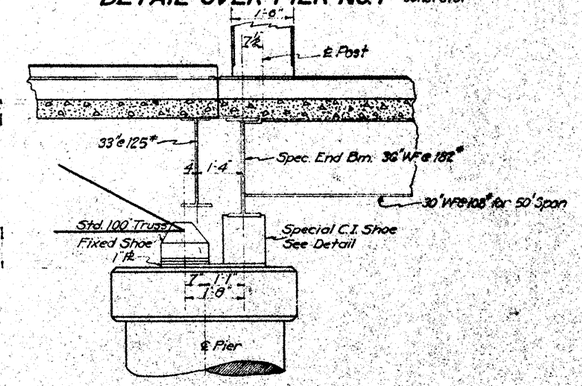
C2 Bars - 1" ϕ

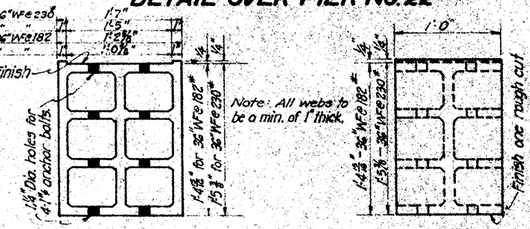


Note:- 1" Bearing Pl. to be continuous under Truss shoe and Spec. C.I. shoe under X-Bm. At Pier #1 and #22 anchor Spec. X-Bms. with 4-1" ϕ anchor bolts at each shoe. Anchor Bolts to be imbedded a min. of 1'-0" into concrete.

DETAIL OVER PIER NO. 1



DETAIL OVER PIER NO. 22



Note: All webs to be a min. of 1" thick.

DETAILS OF SPEC. C.I. SHOES

Note: All concrete shall be poured in the dry.

Concrete in the footings of Piers shall be poured against the rock foundation. The quantity of Class A Conc. in Pier Bases and Substructure Excavation Rock paid for under those items shall be the amount within the neat lines of the concrete as shown on these plans. Any variation in the elevation of Pier Bases shall be taken care of in the shafts, and any additional concrete shall be paid for as Class A Conc. in Pier Bases. All cost of such variation shall be included in the unit price bid per Cu. Yd. for Cl. A Conc. Pier Bases and Substruct. Excav. Rock.

Round Pier Bases of equivalent area and volume may be substituted for the square bases shown. Plans for the round bases shall be submitted to and approved by the State Highway Commission before construction is started.

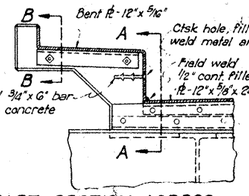
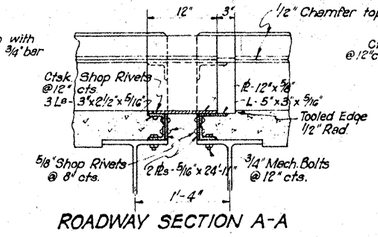
DETAIL OF DRAIN

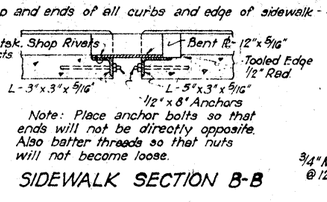
Cast Iron Drains, 4"ϕ x 2'-3" x 3/8" thick to be placed on both sides of the Rdwy. at the center of each panel except in panels adjacent to abutments.



PART SECTION ACROSS EXPANSION DEVICE

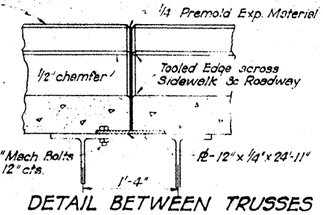


ROADWAY SECTION A-A

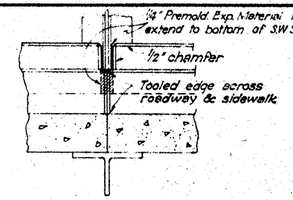


Note: Place anchor bolts so that ends will not be directly opposite. Also batter threads so that nuts will not become loose.

SIDEWALK SECTION B-B

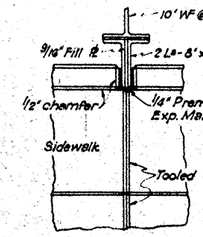


DETAIL BETWEEN TRUSSES AT FIXED JOINTS



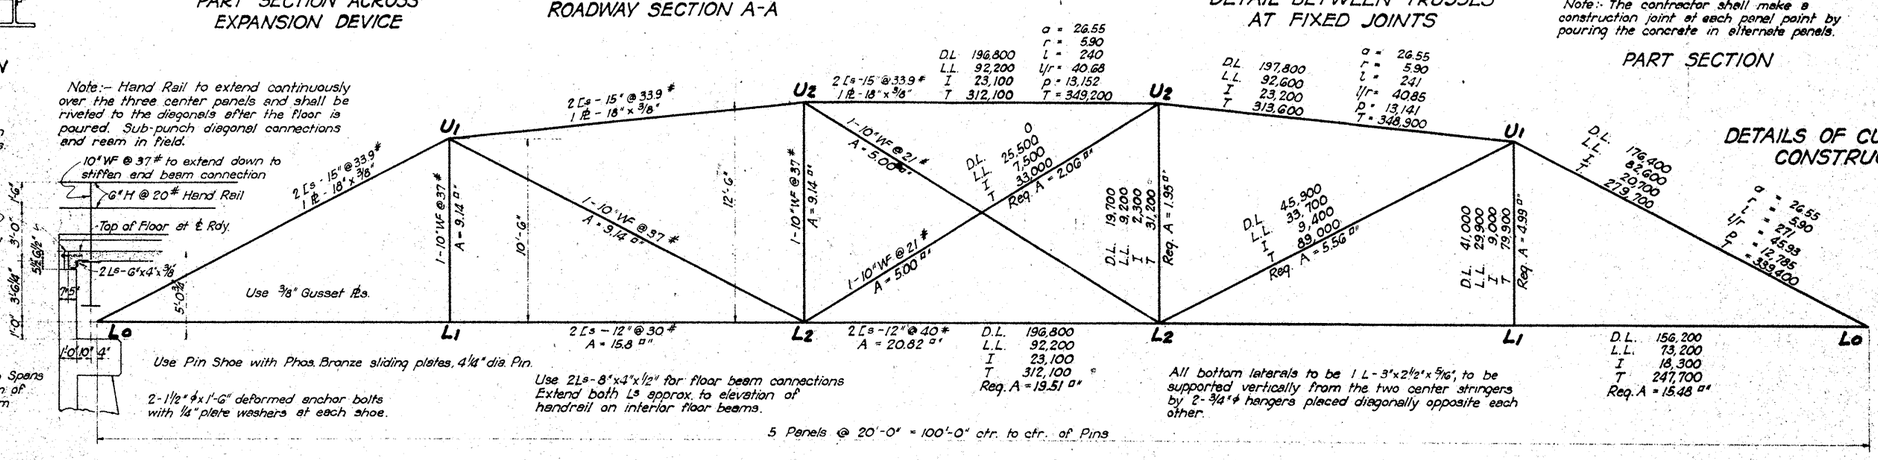
Note:- The contractor shall make a construction joint at each panel point by pouring the concrete in alternate panels.

PART SECTION



PART PLAN

DETAILS OF CURB OPENING AT CONSTRUCTION JOINTS



Note:- When I-Beam Approach Spans are framed into the end beam of the truss, place the end beam directly over the pin.

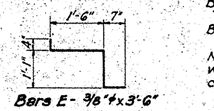
ROADWAY FLOOR AND SIDEWALK

Roadway Slab:- 6 1/2" thick; Class AA Concrete, maximum aggregate 1 1/2".
Sidewalk Slab:- 4" thick, " " " " " "
Section 504, Oklahoma Standard Specifications of 1937 for construction.
Finish roadway and sidewalk floors in accordance with Section 504.04
Top of sidewalk curb to be brought to a true surface with a wooden float; top and sides of sidewalk curb and sides of roadway curbs to have a carborundum block finish. Edges of curbs and sidewalks to have a 1/2" chamfer.
Surface of roadway floor slab to have a crown of 1 1/2" on a parabola. The bridge is designed for a future wearing surface on the roadway floor slab of 2" @ 22.5 lb. per sq. ft.

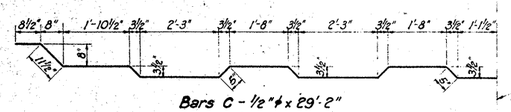
REINFORCING

Bars A - 1/2" ϕ @ 10" cts. across the roadway, 1 3/4" below top of slab.
Bars B - 1/2" ϕ @ 10" cts. across the roadway, 1 1/4" above bottom of slab.
Bars C - 1/2" ϕ @ 10" cts across the roadway, top and bottom of slab, bent as shown.
Bars D - 1/2" ϕ longitudinal, 2 in each sidewalk curb, 24 in roadway. (19'-10" long in interior panels.)
Bars E - 3/8" ϕ @ 5" cts. across the sidewalk, 1 1/4" below top of sidewalk floor.
Bars H - 3/8" ϕ longitudinal, 5 in each sidewalk, spaced as shown.

Note:- Reinforcing steel in floor slab shall be held in place with precast concrete blocks spaced at 2'-0" alternate centers under the top row of 'D' bars.
The end bars of all panels shall be 'C' bars.



Bars E - 3/8" ϕ x 3'-6"



Bars C - 1/2" ϕ x 29'-2"

GENERAL NOTES

All construction shall conform to the Oklahoma Standard Specifications of 1937.

All steel to be structural grade except pins and rollers, which are to be cold rolled or forged. All reinforcing steel to be deformed bars, cold bent; no welds permitted.

All rivets to be 3/4" ϕ except those in 2 1/2" legs of angles which may be 5/8" ϕ. All field rivets to be driven with a pneumatic hammer.

The basis of payment for Structural Steel shall be the weight of the specified section. Sections of equivalent strength will be approved, if requested, but no allowance will be made for increased weight.

Paint: According to the Oklahoma Standard Specifications of 1937 for shop and field, except mechanical equipment may be used for field paint. Second field coat to be aluminum paint.

Concrete materials shall be handled as specified in Sec. 509.04.

All welding shall be in accordance with the A.A.S.H.O. Specifications.

* The following statement shall apply to the 1935 A.A.S.H.O. Specifications: "The paint shall be applied to steel surfaces which have been cleaned and dried. Two coats of paint, of which one coat shall be applied at the field shop, and one coat in the field after erection. Each coat of paint shall be applied to a dry surface. The paint shall be clear and free from water, grit, dirt, skins, or other foreign matter."

All Use of Structural Steel Paints in all contracts up to A.S.T.M. Designation D-261-38 to each paint or paint for first coat of aluminum paint.*

Note:- The basis of payment for structural steel will be the weight of the lightest section specified.
Sections of equivalent strength will be approved but no allowance will be made for increased weight.
All beams for end spans are to be ½" shorter than nominal span length.
All beams for interior spans are to be 1" shorter than nominal span length.

GENERAL NOTES FOR SHOES

All webs to be ⅜" thick.
Bearing surfaces of all shoes shall be finished
Width of shoes to equal flange width of beam plus 2½"
Minimum 3"x ¼" washers for all 1" Anchor bolts.
Minimum 2"x ⅛" washers for all ⅝" Mach. bolts.
Bevel washers for Beth. Beams.
All dimensions for castings shown or noted are minimum and no underrun is permitted.

Live Load: Truck loading as per specifications, Fig. 1, Sec. 515 Impact, 30% of Live Load.

GENERAL NOTES

All construction to conform to Oklahoma Standard Specifications of 1937, as approved by the U.S. Bureau of Public Roads.
The measurement of fine and coarse aggregate shall be by weight in accordance with Sec. 509.04c.
The Concrete Mixer shall comply with the requirements of Section No. 509.03
Concrete Materials shall be handled as specified in Section No. 509.04a
All Concrete in superstructure to be Class AA. All reinforcing steel to be deformed bars, cold bent, no welds permitted. All dimensions relating to reinforcing, spacing are to be to center of bars. When splicing is necessary, bars are to be lapped 40 diameters.
All exposed concrete surfaces to have a carborundum finish. All exposed corners to have ¾" chamfer. All chamfer strips to be sized lumber.
Finish as per specifications in Section No. 509.04f. Finish for floor as per specifications in Section No. 504.04e.

Second field coat shall be Aluminum Paint.

GENERAL NOTES

This construction shall be in accordance with Okla. Std. Specifications of 1937.
All exposed concrete surfaces to have a carborundum finish.
Bearing areas of concrete under all shoes shall be ground with a carborundum brick before placing shoes to secure full bearing of shoes on concrete.
Anchor all I Bms at ends marked "Fixed" on General Elevation with 2-1"x1'-6" anchor bolts.
For details of 1" Rubber Expansion Joint Filler see Std. CT-6 and Sec. 722.02 Okla. Std. Specifications of 1937.

Note: Approx. 750 Cu Yds of Class A Excavation reqd to make fill around Abutments is to be obtained as directed by the Resident Engineer. The fill around Abuts. shall be placed and compacted in accordance with Sec. 202.04c.

Note: A 40' R.C. Test Pile shall be driven as shown in Abut. & Cap details at the following locations- Abuts. No. 1 & 2, and Bents No. 3-6-9-12-15-18-21, & 24. All R.C. Piles shall be driven with a Vulcan No. 1 or equivalent steam hammer. High early strength cement may be used for R.C. Piling, see Sec. 510 of Okla. Std. Spec. of 1937.

Note: For details of Superstructure see sheet no. 17 and Std. CT-6, sheet no. 18.
For details of Abutments see sheet no. 11.

Note: The structural steel shall be painted in accordance with Sec. 506.04 and Sec. 730 except that three field coats of paint shall be applied, one of red lead (first field spec.) and two of aluminum (second field spec.).

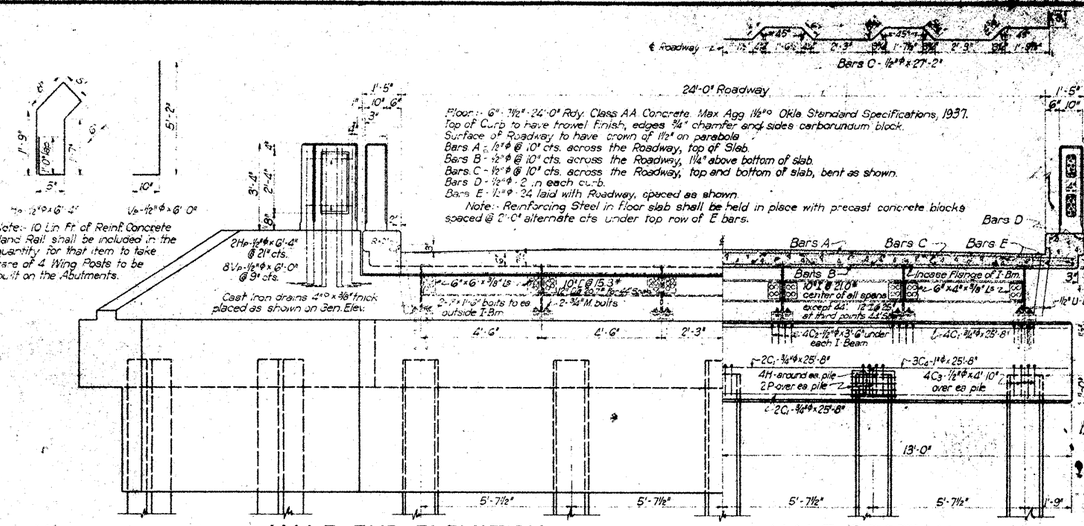
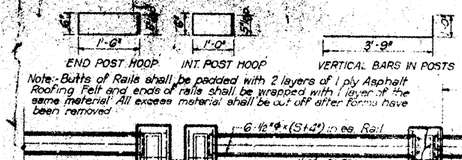
	OKLA.				

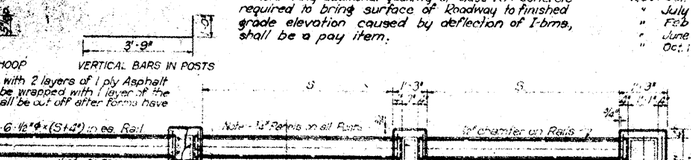


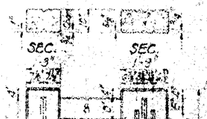
Floor: 6" 1½#-24'-0" Rdy. Class AA Concrete. Max. Agg. 1½". Okla. Standard Specifications, 1937.
Top of Curb to have trowel finish, edges ¾" chamfer and sides carborundum block.
Surface of Roadway to have crown of 1½" on parabola.
Bars A - ½"ϕ @ 10" cts. across the Roadway, top of Slab.
Bars B - ½"ϕ @ 10" cts. across the Roadway, 1¼" above bottom of slab.
Bars C - ½"ϕ @ 10" cts. across the Roadway, top and bottom of slab, bent as shown.
Bars D - ½"ϕ - 2 in each curb.
Bars E - ½"ϕ - 24 laid with Roadway, spaced as shown.
Note: - Reinforcing Steel in floor slab shall be held in place with precast concrete blocks spaced @ 2'-0" alternate cts. under top row of E bars.

Note: - 10 Lin. Ft. of Reinf. Concrete Hand Rail shall be included in the quantity for that item to take care of 4 Wing Posts to be built on the Abutments.

Note: - Butts of Rails shall be padded with 2 layers of 1 ply Asphalt Roofing Felt and ends of rails shall be wrapped with 1 layer of the same material. All excess material shall be cut off after forms have been removed.







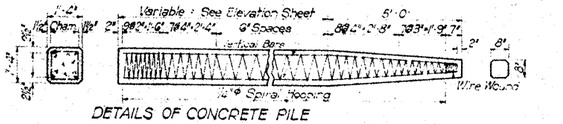
3"x 12" Bumper bolted to crown of Bridge Floor and fastened with ⅝"x 8"M bolts and washers, spaced 2'-0" cts. Cost of bumpers to be included in the price bid for Class A A Conc. in Floor.

Note: - ¼" Premolded Expansion Material in Const. Joints in Floor over each bent.
Tooled edge across Roadway at Const. Joints.
Ends of curbs to have ¾" chamfer on top and sides at Const. Joints.

Note: - I-Bms. for 36' and 40' spans to be rolled with ¾" camber.

PART SECTION

PART SIDE ELEVATION

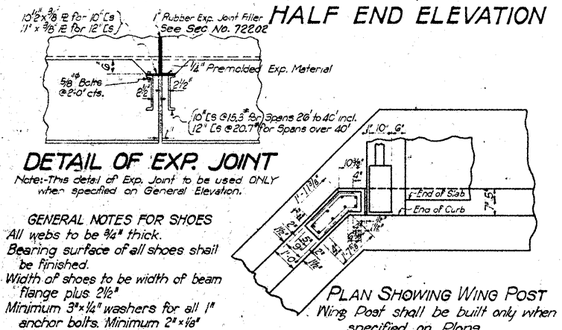


DETAILS OF CONCRETE PILE

NOTE - Equipment required for driving piles: No 1 Vulcan Hammer or equivalent steam hammer, and if necessary, to obtain required penetration without damage to piles, a pump and equipment sufficient to furnish 500 gallons per minute at two ¾" nozzles. Class AA Concrete to be used for piling. Max. Agg. 1½". All exposed surfaces of reinforced concrete piles shall have a carborundum finish. Vertical bars in piling for lengths less than 35' use 4-½"ϕ bars for lengths of 35' to 39' use 6-½"ϕ bars for lengths of 40' and over use 8-½"ϕ bars.

When piling cast, as determined by test piles, are of such a length as to cause an increase in the weight of steel used per lineal ft. of pile over that required in the piles as shown on the plans, such increased weight of steel will be measured and paid for as provided in Sec. 511 at the contract unit price bid for other reinforcing steel used in the structure.

The use of High Early Strength Cement will be permitted. See note below.



DETAIL OF EXP. JOINT

Note: - This detail of Exp. Joint to be used ONLY when specified on General Elevation.

PLAN SHOWING WING POST
Wing Post shall be built only when specified on Plans.

GENERAL NOTES FOR SHOES

All webs to be ¾" thick.
Bearing surface of all shoes shall be finished.
Width of shoes to be width of beam flange plus 2½"
Minimum 3"x¼" washers for all 1" anchor bolts. Minimum 2"x⅛" washers for all ¾" Misch. bolts.
Bevel all washers for Beth. Beams.
All dimensions of castings shown or noted are minimum and no under-run is permitted.

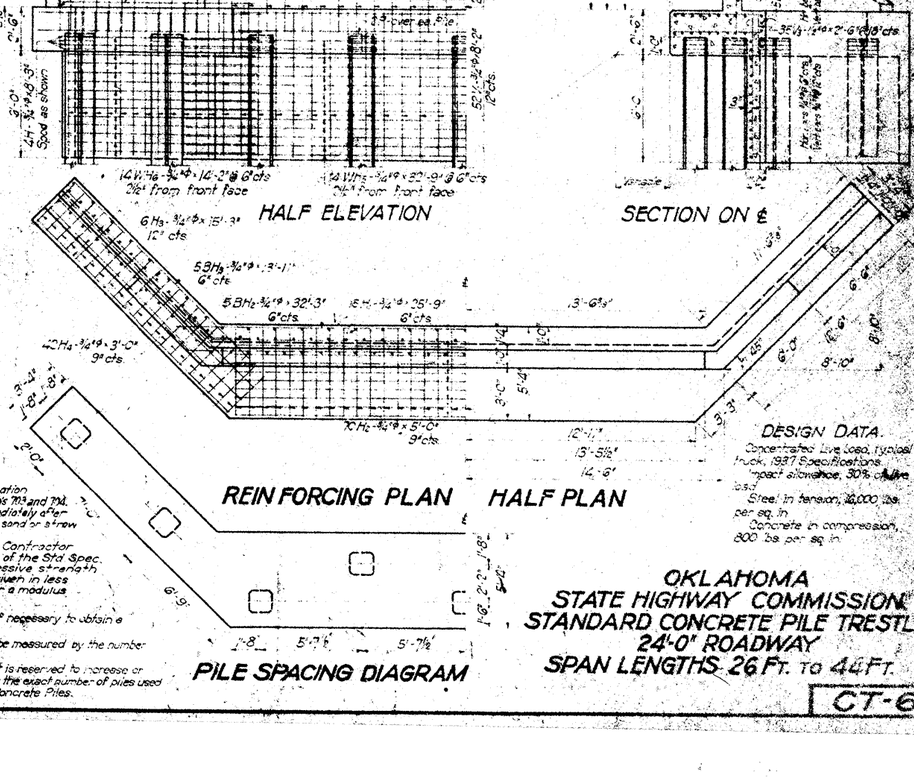
Note: - The basis of payment for structural steel will be the weight of the lightest section specified. Sections of equivalent strength will be approved but no allowance will be made for increased weight.

GENERAL NOTES

All construction to conform to the Oklahoma Standard Specifications of 1937, as approved by the U.S. Bureau of Public Roads.
The measurement of fine and coarse aggregate shall be by weight in accordance with Section No. 509.04c.
The Concrete Mixer shall comply with the requirements of Section No. 509.05.
Concrete Materials shall be handled as specified in Section No. 509.04a.
All concrete in superstructure to be Class A A. All reinforcing steel to be deformed bars, cold bent, no welds permitted. All dimensions relating to reinforcing spacing are to center of bars. When splicing is necessary, bars are to be lapped 40 diameters.
All exposed concrete surfaces to have a carborundum finish. All exposed corners to have ¾" chamfer except where otherwise noted. All chamfer strips to be sized lumber.
Slab and Curbs must be poured at the same time allowing no time for initial set to take place between them.
Finish as per specifications in Section No. 509.06. Finish for floor as per specifications in Section No. 504.04a.
Second field coat shall be Aluminum Paint.
All beams for end spans are to be ½" shorter than nominal span length.
All beams for interior spans are to be 1" shorter than nominal span length.
Bearing areas of Concrete under all shoes shall be ground with a Carborundum brick before placing shoes to secure full bearing of shoes on Concrete.

NOTE: - SPECIAL PROVISIONS FOR CONCRETE TEST PILES.

DESCRIPTION: The lengths of piles shown on the plans are for estimating purposes only and are not guaranteed. The actual lengths to be used will be determined after driving the specified number of test piles at the locations shown on the plans.
MATERIAL: Test piles shall be made of Class A A Concrete. The use of a standard approved brand of High Early Strength cement will be permitted which conforms to the requirements of the A.S.T.M. serial designation C 74 - 30 T, or subsequent revisions thereto. The aggregate shall conform to the requirements of Sec. Nos. 703 and 704.
CURING: Piling shall be covered with 8 inches of previously wetted burlap laid longitudinally on piling immediately after concrete is placed and the burlap shall be kept saturated for one day. The piling shall then be covered with clean sand or straw and kept continuously wet for 5 more days.
DRIVING EQUIPMENT: Equipment for driving test piles shall be identical with that which the Contractor proposes to use on the regular piles and shall conform in every way with the requirements of the Std. Spec.
DRIVING PILES: Test cylinders or beams, or both, shall be made and tested for compressive strength or modulus of rupture. Test piles, when High Early Strength Cement is used, shall not be driven in less than 7 days after casting, and in no event until a compressive strength of 4,000 per sq. in. or a modulus of rupture of 700 per sq. in. has been obtained, to the satisfaction of the Engineer.
Piles shall be driven to the elevations shown on the plans or to a greater depth if necessary to obtain a bearing capacity of twenty-five (25) tons per pile.
METHOD OF MEASUREMENT: Concrete test piles shall be cast to the lengths specified on the plans and shall be measured by the number of piles complete in place.
BASIS OF PAYMENT: Concrete test piles will be paid for at the unit price bid per pile complete in place. Right is reserved to increase or decrease the number of test piles. In case of such variation the unit price bid by the Contractor shall prevail for the exact number of piles used. Build ups on test piles due to driving below grade will be paid for at the unit price bid per lin. ft. for Reinforced Concrete Piles.



DESIGN DATA.

Concentrated Live Load, Typical truck, 1937 Specifications.
Impact allowance, 30% of Live Load.
Steel in tension, 16,000 lbs. per sq. in.
Concrete in compression, 800 lbs. per sq. in.
